

Removal of swales

There are three lime trees in the area where the swale was to be located, our Arboriculturist decided that he would like to retain the trees as they provided significant amenity value and they should be retained at the loss of the swale. Since that time it has been agreed to include part of the area into a play area and to install a flood attenuation tank close to Block E2, to replace the swale, this is to be undertaken within the next 5 – 6 weeks. In subsequent phases of the development it may be that new swales may be incorporated but at this stage there are no firm design matters associated to any further swales.
